### 3.2 BACKLIGHT UNIT

#### 3.2.1 CCFL CHARACTERISTICS

$T_a = 25 \pm 2 ^\circ\text{C}$

Parameter	Symbol	Value			Unit	Note
		Min.	Typ.	Max.		
Lamp Input Voltage	$V_L$	(932)	(1036)	(1140)	$V_{\text{RMS}}$	$I_L = 5.0 \text{ mA}$
Lamp Current	$I_L$	(4.5)	(5.0)	(5.5)	$\text{mA}_{\text{RMS}}$	(1)
Lamp Turn On Voltage	$V_S$			(1920 (0°C))	$V_{\text{RMS}}$	(2)
				(1620 (25°C))	$V_{\text{RMS}}$	(2)
Operating Frequency	$F_L$	(48)	(55)	(70)	KHz	(3)
Lamp Life Time	$L_{\text{BL}}$	40,000			Hrs	(5), $I_L = 5.0 \text{ mA}$
Power Consumption	$P_L$		(83)		W	(4), $I_L = 5.0 \text{ mA}$

Note (1) Lamp current is measured by current amplify & oscilloscope as shown below:

Note (2) The voltage that must be larger than  $V_s$  should be applied to the lamp for more than 1 second after startup. Otherwise, the lamp may not be turned on normally.

Note (3) The lamp frequency may produce interference with horizontal synchronization frequency from the display, which might cause line flow on the display. In order to avoid interference, the lamp frequency should be detached from the horizontal synchronization frequency and its harmonics as far as possible.

Note (4)  $P_L = I_L \times V_L \times 16$

Note (5) The lifetime of lamp can be defined as the time in which it continues to operate under the condition  $T_a = 25 \pm 2 ^\circ\text{C}$  and  $I_L = 5.0 \text{ mA}_{\text{RMS}}$  until one of the following events occurs:

- (a) When the brightness becomes or lower than 50% of its original value.
- (b) When the effective ignition length becomes or lower than 80% of its original value. (Effective ignition length is defined as an area that has less than 70% brightness compared to the brightness in the center point.)

Note (6) The waveform of the voltage output of inverter must be area-symmetric and the design of the inverter must have specifications for the modularized lamp. The performance of the Backlight, such as lifetime or brightness, is greatly influenced by the characteristics of the DC-AC inverter for the lamp. All the parameters of an inverter should be carefully designed to avoid producing too much current leakage from high voltage output of the inverter. When designing or ordering the

inverter please make sure that a poor lighting caused by the mismatch of the Backlight and the inverter (miss-lighting, flicker, etc.) never occurs. If the above situation is confirmed, the module should be operated in the same manners when it is installed in your instrument.

The output of the inverter must have symmetrical (negative and positive) voltage waveform and symmetrical current waveform.(Unsymmetrical ratio is less than 10%) Please do not use the inverter which has unsymmetrical voltage and unsymmetrical current and spike wave. Lamp frequency may produce interface with horizontal synchronous frequency and as a result this may cause beat on the display. Therefore lamp frequency shall be as away possible from the horizontal synchronous frequency and from its harmonics in order to prevent interference.

Requirements for a system inverter design, which is intended to have a better display performance, a better power efficiency and a more reliable lamp. It shall help increase the lamp lifetime and reduce its leakage current.

- The asymmetry rate of the inverter waveform should be 10% below;
- The distortion rate of the waveform should be within  $\sqrt{2} \pm 10\%$ ;
- The ideal sine wave form shall be symmetric in positive and negative polarities

\* Asymmetry rate:  
 $|I_p - I_{-p}| / I_{rms} * 100\%$

\* Distortion rate  
 $I_p \text{ (or } I_{-p}) / I_{rms}$

Note (1) Definition of Viewing Angle ( $\theta_x, \theta_y$ ):

Note (2) Definition of Contrast Ratio (CR):

The contrast ratio can be calculated by the following expression.

$$\text{Contrast Ratio (CR)} = L_{255} / L_0$$

$L_{255}$ : Luminance of gray level 255

$L_0$ : Luminance of gray level 0

**CR = CR (1)**

CR (X) is corresponding to the Contrast Ratio of the point X at Figure in Note (6).

Note (3) Definition of Response Time ( $T_R, T_F$ ):

**Preliminary**

Note (4) Definition of Luminance of White ( $L_c$ ):

Measure the luminance of gray level 255 at center point

$$L_c = L(1)$$

$L(x)$  is corresponding to the luminance of the point X at Figure in Note (6).

Note (5) Measurement Setup:

The LCD module should be stabilized at given temperature for 20 minutes to avoid abrupt temperature change during measuring. In order to stabilize the luminance, the measurement should be executed after lighting Backlight for 20 minutes in a windless room.

Note (6) Definition of White Variation ( $\delta W$ ):

Measure the luminance of gray level 255 at 13 points

$$\delta W = \frac{\text{Maximum } [L(1), L(2), L(3), L(4), L(5), L(6), L(7), L(8), L(9), L(10), L(11), L(12), L(13)]}{\text{Minimum } [L(1), L(2), L(3), L(4), L(5), L(6), L(7), L(8), L(9), L(10), L(11), L(12), L(13)]}$$

Note (7) Definition of Response Time ( $T_{GTG\_AVE}$ ):

$T_{GTG\_AVE}$  is defined as the total average response time for "Gray To Gray".

The Gray to Gray response time is defined as the following chart.

Gray to Gray		Target Gray								
		G0	G32	G64	G96	G128	G160	G192	G224	G255
Initial Gray	G0	X

	G128									
	G160									
	G192									
	G224

## 10. PRECAUTIONS

### 10.1 ASSEMBLY AND HANDLING PRECAUTIONS

- (1) Do not apply rough force such as bending or twisting to the module during assembly.
- (2) To assemble or install module into user's system can be only in clean working areas. The dust and oil may cause electrical short or worsen the polarizer.
- (3) It's not permitted to have pressure or impulse on the module because the LCD panel and Backlight will be damaged.
- (4) Always follow the correct power sequence when LCD module is connecting and operating. This can prevent damage to the CMOS LSI chips during latch-up.
- (5) Do not pull the I/F connector in or out while the module is operating.
- (6) Do not disassemble the module.
- (7) Use a soft dry cloth without chemicals for cleaning, because the surface of polarizer is very soft and easily scratched.
- (8) It is dangerous that moisture come into or contacted the LCD module, because moisture may damage LCD module when it is operating.
- (9) High temperature or humidity may reduce the performance of module. Please store LCD module within the specified storage conditions.
- (10) When ambient temperature is lower than 10°C may reduce the display quality. For example, the response time will become slowly, and the starting voltage of CCFL will be higher than room temperature.

### 10.2 SAFETY PRECAUTIONS

- (1) The startup voltage of Backlight is approximately 1000 Volts. It may cause electrical shock while assembling with inverter. Do not disassemble the module or insert anything into the Backlight unit.
- (2) If the liquid crystal material leaks from the panel, it should be kept away from the eyes or mouth. In case of contact with hands, skin or clothes, it has to be washed away thoroughly with soap.
- (3) After the module's end of life, it is not harmful in case of normal operation and storage.
